

How I Became Windows-Free

Jeff Savit

Technologist, Data Center Advanced Services Practice
Sun Microsystems

A time span before, during, and after Windows

Orientation

- This will mostly be a “personal story”
- No religion is intended, implied or explicit
- This is not meant to be a sales pitch, though I will talk about some practices at my employer which we also (surprise!) sell
- If I don't mention your favorite tool, toy, OS, or cheese please don't be upset – these are my observations and practices

Yes, Virginia – there are other desktop environments

- Motivation for using Windows alternatives include
 - > Security
 - > Management services (software, user or policy management/automation)
 - > Multi-user capabilities
 - > Compatibility between server and desktop environments
 - > Price / TCO
 - > Hardware platform choice
 - > Cultural/political reasons
- Obstacles
 - > Windows-only software products
 - > Windows orientation of much PC hardware
- Results and Experiences
 - > I'll discuss the (mostly) good, plus the limitations

Personal history

- In the Golden Age
 - > 3270 terminals, XEDIT for word processing, REXX for scripting, and NOTE, RICEMAIL or PROFS for e-mail
 - > Neolithic age: glass TTY on both CMS and Unix
 - > Stone age: real TTY...
- At previous employer
 - > Windows the standard desktop, MS Office, Exchange and Outlook for e-mail. KEDIT (for me at least) text editing
 - > I kept public e-mail address on VM for virus insulation; distinctly counter to “standard policy”
- Now
 - > Solaris and Linux my standard desktop, about 50/50, with same tools, email and documents
 - > Now Windows-free. Well, almost

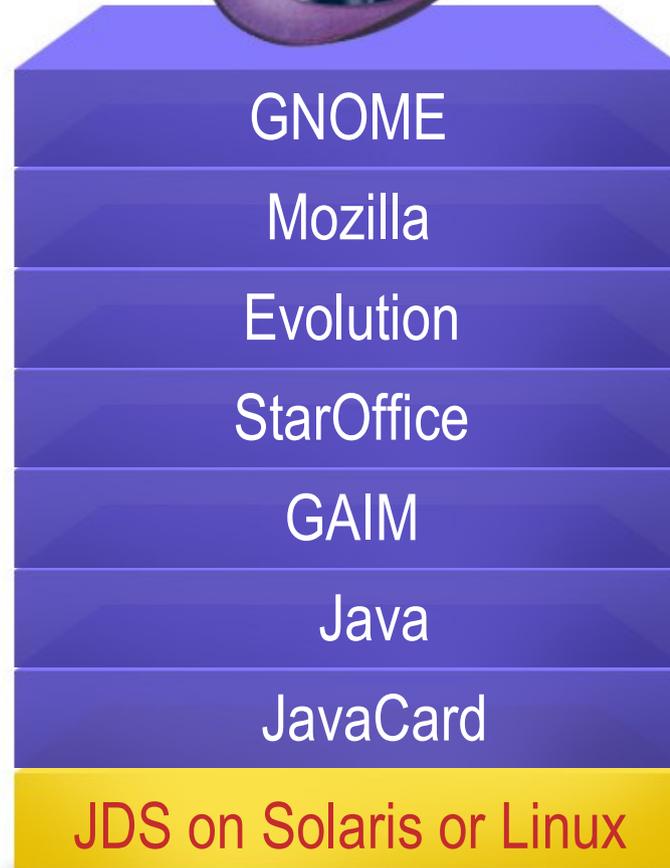

At Sun

- Strong preference to not use MS product... (no kidding, eh?)
 - > Sun is likely one of the few big companies largely not using Windows
- When I joined Sun in 2000:
 - > Standard was a Sun workstation (eg: Ultra 10) running Solaris. CDE, Netscape, early StarOffice, dtmail, vi, emacs
 - > Remote login and home directory for worldwide access
 - > Field staff had laptops for presentations and on-site work
 - > Mostly Windows, except for very early adopters of Linux on laptops
 - > Loyal, unofficial, passionate Macintosh following
- Now:
 - > Standard is Sun Ray thin client (I'll describe) to Solaris. GNOME, Mozilla, Thunderbird, Evolution, Firefox, StarOffice
 - > Field staff have laptops; most run either Linux (either our “Java Desktop System” customization of SuSE, or RH) or Solaris
 - > Loyal, unofficial, passionate Macintosh following (has grown)

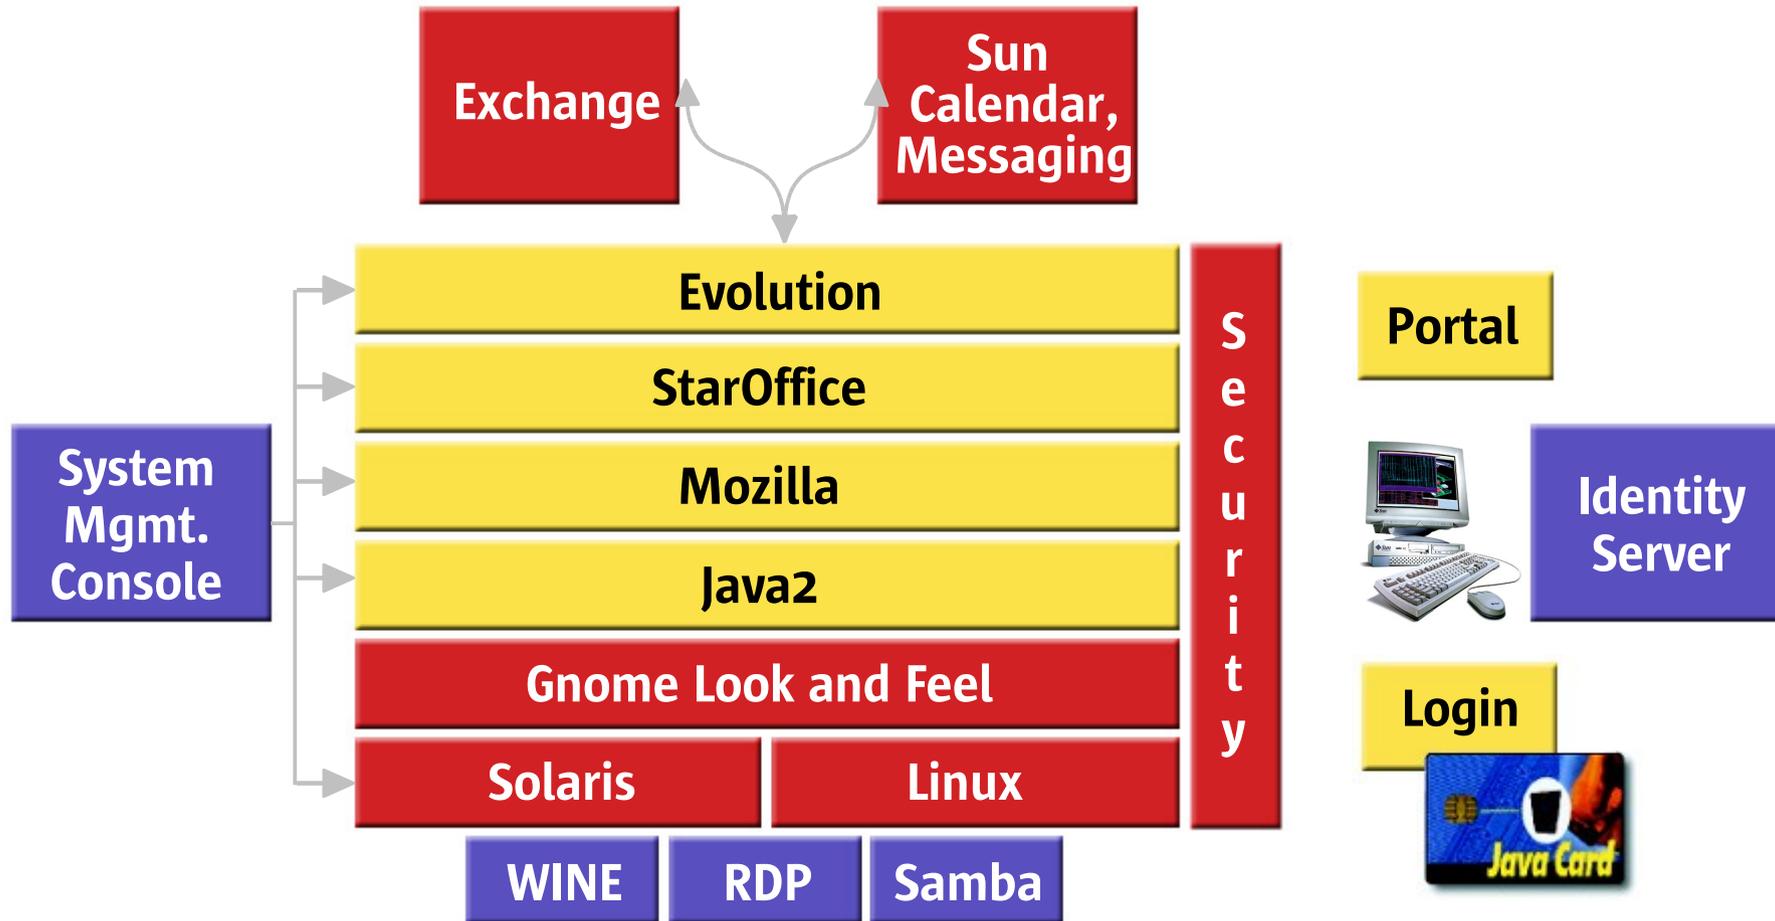

Desktop

- Desktop that would be recognizable to most Windows users is a first step
- Open world choices: KDE, GNOME, plus alternatives and various dialects/customizations
- Consideration of “who is the user”
 - > “Techie” population fraction of the larger base
 - > Office worker
 - > Personal/home use – things should be familiar and “just work”
- Need set of core apps (based on audience) that map onto the typical MS Windows experience

Functional equivalency

- Based on target audience, requires feature set that covers all/most of Windows user experience
- Depending on user, something is probably either missing or “doesn't work the same”. This is not necessarily a show stopper
- For corporate environments, may need to continue to provide access to legacy Windows applications even if desktop system is something else
 - > Eg: Use Tarantella, Citrix, rdesktop, vnc...
- But, let's walk through some major function categories...

Internet access

- Mozilla or Firefox instead of Internet Explorer
- In almost all ways a substantial improvement
 - > See blog by ex-IE developer on why he switched to Firefox at <http://www.scottberkun.com/blog/?p=115>
- Tabbed viewing, better CSS compliance
- Most important: no more risk from IE exploits
 - > Mozilla family has the rare hole, IE is always open
- Downsides:
 - > IE-only sites (IE dialect rendering, MS JVM, Javascript and CSS). Rare, I think, except in corporate intranets
 - > ActiveX not available: not an issue for me, considering my employer, and little or no use of ActiveX on Internet sites (ActiveX one of the reasons IE has security problems)

E-mail access

- Choice of either Evolution, Thunderbird, or Mozilla e-mail client instead of Outlook
 - > Choice from the above is personal preference; all work well as IMAP clients (how I use them), have nice interfaces, etc
 - > Evolution also has Exchange connector
 - > All three work with Exchange if IMAP turned on
 - > All three available on Linux, Solaris, Windows, etc
- Risk avoidance for viruses: Outlook (“petri dish”) is too willing to execute attachments
- I receive virus e-mails all the time (who doesn't?) and respond with as little angst as when I used PROFS
 - > A fish can't catch cold from a giraffe

Office processing

- StarOffice instead of MS Office
 - > Sun bought the company that produces it some years ago
 - > Also available as OpenOffice: free, open-source project
 - > Widely used on non-Windows platforms
- SO/OO analogues for MS Office components
 - > Presentations like this (eg: PowerPoint)
 - > Word processing (eg: Word)
 - > Spreadsheets (eg: Excel)
 - > SO/OO can read or write its own file formats, or read/save-as MS Office formats (.ppt, .doc, .xls)
 - > Can export to PDF in three clicks. I like that
- Instantly wave goodbye to macro viruses...
- Limitations: Macros must be ported. SO has a migration tool for spreadsheets: works well, but not 100%

Programmers and friends

- Need slightly different things than Joe User
- Decent editor for text files
 - > Used XEDIT on VM/CMS, KEDIT on Windows
 - > vi/vim not a substitute
 - > Intense pain in beginning
 - > Since have found a plethora of more than adequate editors: nedit, jEdit, j, etc.
- Development tools
 - > Plenty of Java and C tools on Solaris or Linux
 - > REXX if you look for it
 - > Only the original Unix pipes, alas

Crutches

- When you really need that Windows application
- Can run Windows applications via Wine
- Questions of completeness, robustness, ISV certification or support, licensing
- Commercial packaging via CrossOver suite
- Doesn't address device driver or other “system-y” things
- Also: can use VMware or similar to actually run Windows. Definitely out of the “Joe User” category

PDA's and Multimedia

- Most PDA support (Palm, Treo, Blackberry) oriented around Windows
- PalmOS products (Palm, Treo, others) can be made to work with Linux and Solaris
 - > Jpilot, PDAsync, Evolution, pilot-manager, etc
 - > Need current level versions of Linux or Solaris
 - > USB vs. serial requires some work, reading docs
- Movies and sound are not a problem:
 - > I use xine and xmms; there are plenty of others
 - > RealAudio also available

Return of the thin client

Thin client – what's old is new again (sort of)

- No on-site computer – remote timesharing again!
- Server drives screen, keyboard and mouse
 - Pixel changes and user events transmitted
 - Server may or may not host actual apps
 - Can be Solaris or Linux
- Mobile sessions with Javacard
- Reconnect session, windows “as is”
- No viruses (No local OS or HW upgrades)
- Power savings: (unit uses <20W + display)
- Sun experience: 2 admins for every 4000 desktops
- Software deployments much easier
- “Stateless” device eliminates data theft/corruption
 - Can run via broadband to home or remote office, too

MOBILITY: Secure Javacard authentication

Exceptions and leftovers

- Not many: I rarely boot Windows
 - > When I do: first thing I do after boot is update virus protection, even though I'm behind firewalls
- iPod: iTunes client runs only on Windows and Mac
 - > Open source alternatives like GTKPod and myPod but they're not as good, and don't plug into Apple's music store
 - > iPod as FAT disk drive works fine under Linux or Solaris
- Scanner: I bought one that only has a Windows driver
- Wireless
 - > Works on Solaris and Linux (both pretty recent); I just haven't gotten around to it
- Internet access at some hotels: funny IE-specific redirect to their “do you accept this charge” page

The Security Question

- Some people say “Windows is attacked more only because it's so popular”, and isn't insecure by nature
 - > Popularity does make Windows a target (a virus writer hits the biggest population) but there really are differences.
 - > Non-Windows OSes manage a lot of money. If they were easy to crack, they'd be penetrated all the time too, for profit.
- Windows, MS Office, Outlook, IE designs all include choices that have made security exposures common
 - > ActiveX in general (untrustable content executing on my machine?), lack of a real protection model, happiness to execute attachments while hiding their extensions, and many other features
- Moving to an alternative increases your security, even if Windows isn't inherently insecure

Other choices/ideas

- Q: Why didn't you mention OS X, BSD, etc?
 - > Because I don't use them and don't know much about them
 - > I hear Mac OS X is really good, and things Just Work, but I wanted to suffer the slings and arrows...
- Q: Why didn't you mention <cool package XYZ>?
 - > I don't know – tell me about it. It might be something I never heard of that would make my life easier
- Q: Is <program XYZ> available outside Windows?
 - > Maybe, maybe not. If the question is “Is XYZ available”, the answer might be “no”, but there may be a substitute. Eg: use GIMP instead of Adobe Photoshop. Think “function” rather than “product”
- Q: Could you use a 3270 again?
 - > Only a 3279-3 with really good phosphor intensity

Getting Started

- Evaluate your needs and environment
 - > Compatibility with corporate standard for documents or platform
 - > Application needs: Internet, mail, graphics or multimedia, PDA support, wireless, music, program development, many others
 - > Desire to learn a particular platform
- Select OS and (if Linux, a distro) and install it
 - > iMac or Mac Mini require a new machine
 - > Linux or Solaris can coexist on Windows PC
- Live in new environment
 - > List what is missing, rank “must have” or “nice to have” features
 - > Look for equivalent tools/methods: they may exist
 - > List features you like/dislike
 - > Try to distinguish between the feature itself and your response to it because it's new and different

Coexistence

- All-at-once conversion unlikely
 - > Prepare to switch between “production” and “test” environments
 - > Back up files and have method to make available to both OSes
- Coexistence on same machine (Solaris or Linux)
 - > Can partition disk so Windows and new OS are both available
 - > I suggest booting to GRUB and then selecting OS
 - > Use VMware instead, and install new environment as a guest
 - > Easy to destroy existing Windows environment. Disk sharing requires knowledge of partitioning and other magic tricks
 - > Use a FAT32 partition for data sharing, as most OSes know how to read and write it – unlike NTFS
- Coexistence via spare or new machine: safe, easy
 - > Mandatory with iMac or Mac Mini
 - > Consider using a KVM switch for keyboard/mouse/display sharing

Conclusions

- Yes, there is “life after Windows”
- It's less scary. I open e-mail without fear
- I use same OSes for development and “every day” desktop work
 - > example: bring up Grid Engine under Solaris or Linux
 - > I can debug with Dtrace, or use a Zone as a sandbox
- I can still waste time playing music, watching movies
- Device support sufficient to my needs
- Occasional pieces missing but gaps closing
 - > A few years ago Linux-on-laptop was an adventure; now it's at “glitch” level. Similar with Solaris 10
- I'm glad I switched
